# Installation Manual

## 1.Introduction

The following document provides the necessary information for the proper installation of the web page Event. A step-by-step description, as well as the specification of the necessary prerequisites.

## 2. Installation

For the proper installation your equipment must comply with the prerequisites. After you have everything set up continue with the installation as described.

### 2.1 Prerequisites

#### 2.1.1 Install WAMP / LAMP / MAMP

You need to install either WAMP / LAMP / MAMP or XAMP whichever fits your operating system best or you fill more comfortable with.

You can install them from the following links:

**Windows:** <https://bitnami.com/stack/wamp>

**Mac:** <https://bitnami.com/stack/mamp>

**Linux:** <https://bitnami.com/stack/lamp>

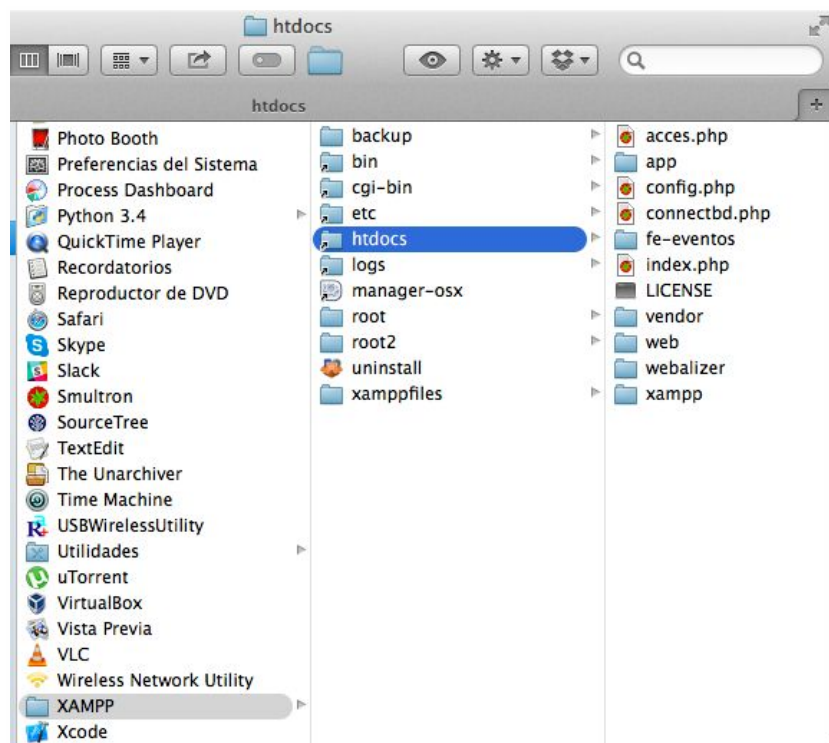

**Xampp:** <https://www.apachefriends.org/es/index.html>

## 2.2 Step-by-step

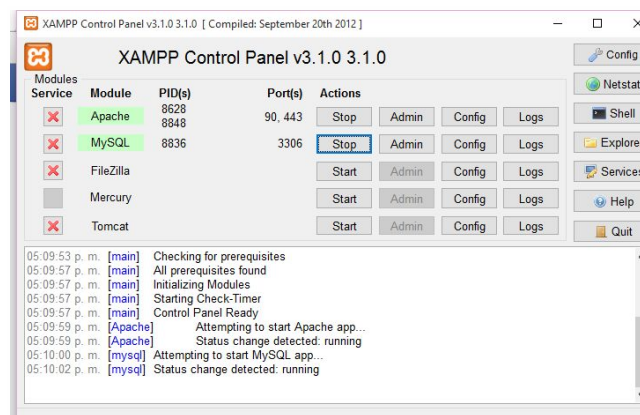

Follow the next step as described.

### 2.2.1 Download the file

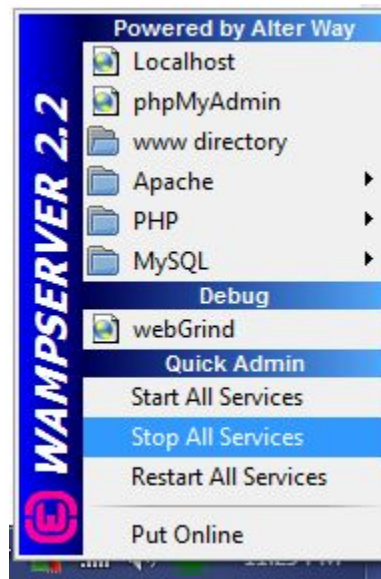

Once you download the file extract the zip of the project on the *htdocs* folder, that is under the wamp/mamp/lamp/xampp folder.

In order to run files you should initialize the services of “Apache” and “MySQL” in XAMPP you must open the XAMPP control panel and click “start” for both services.

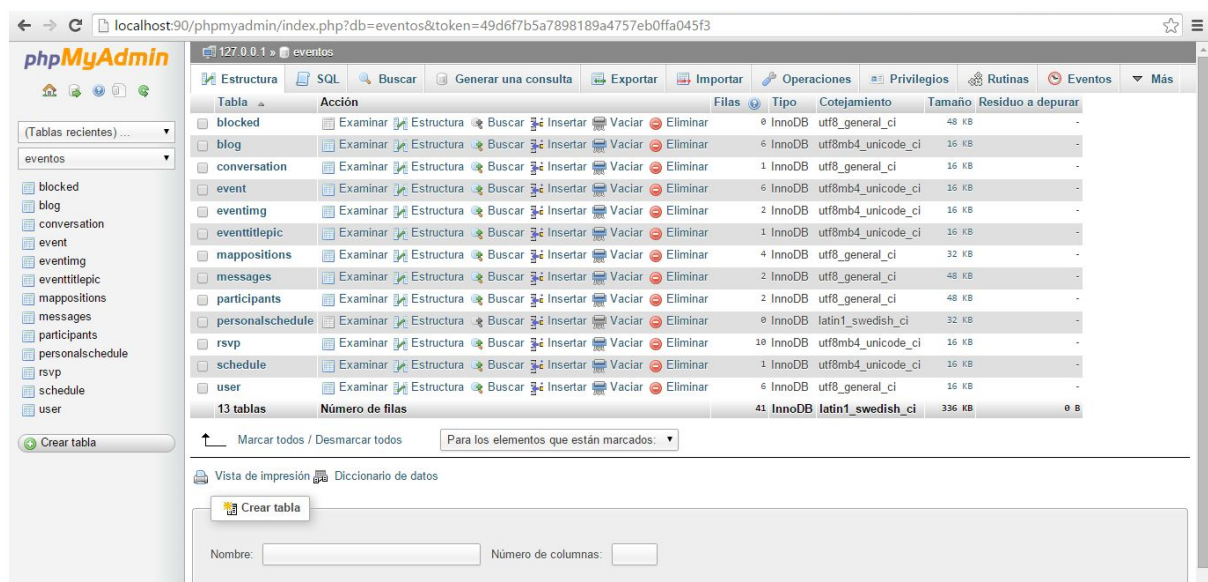

In the part of WAMP:

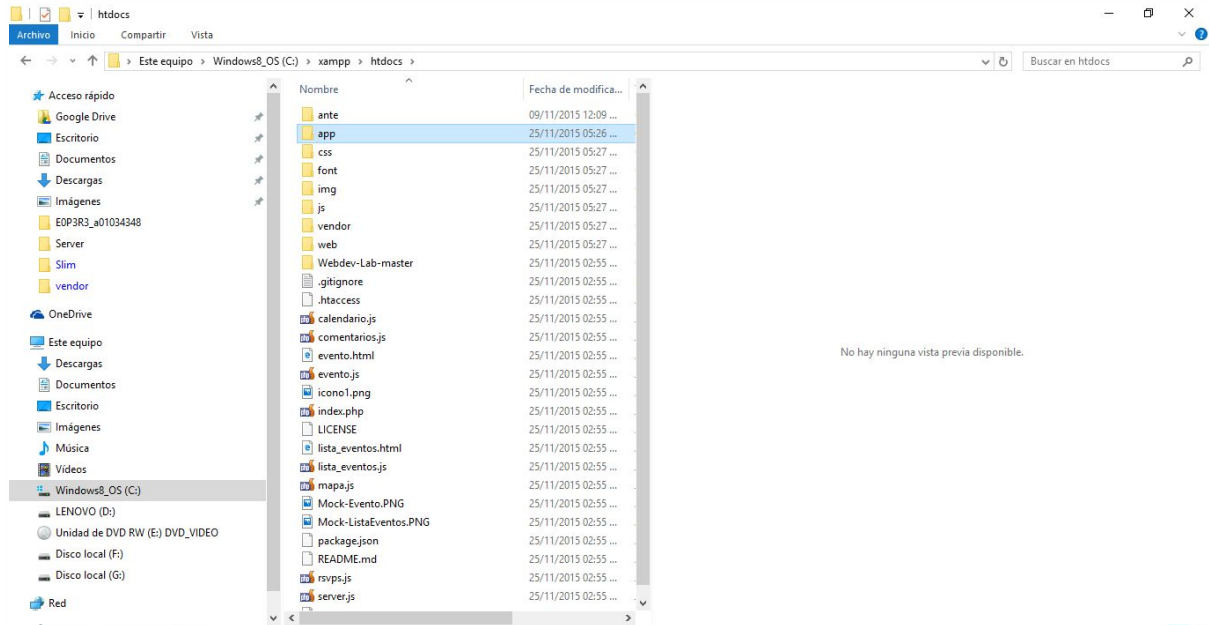

## 2.2.2 Run the script

Run the init script of the database in the link localhost/phpmyadmin, create a database called “eventos” and remember in the file “database.php” in the folder /app/config modify the user and the password to your own user and password of the phpmyadmin, usually this is “root” and empty password. In the part of SQL run the script of the database and it should look like this right after running it.:

## 2.2.3 Run the project

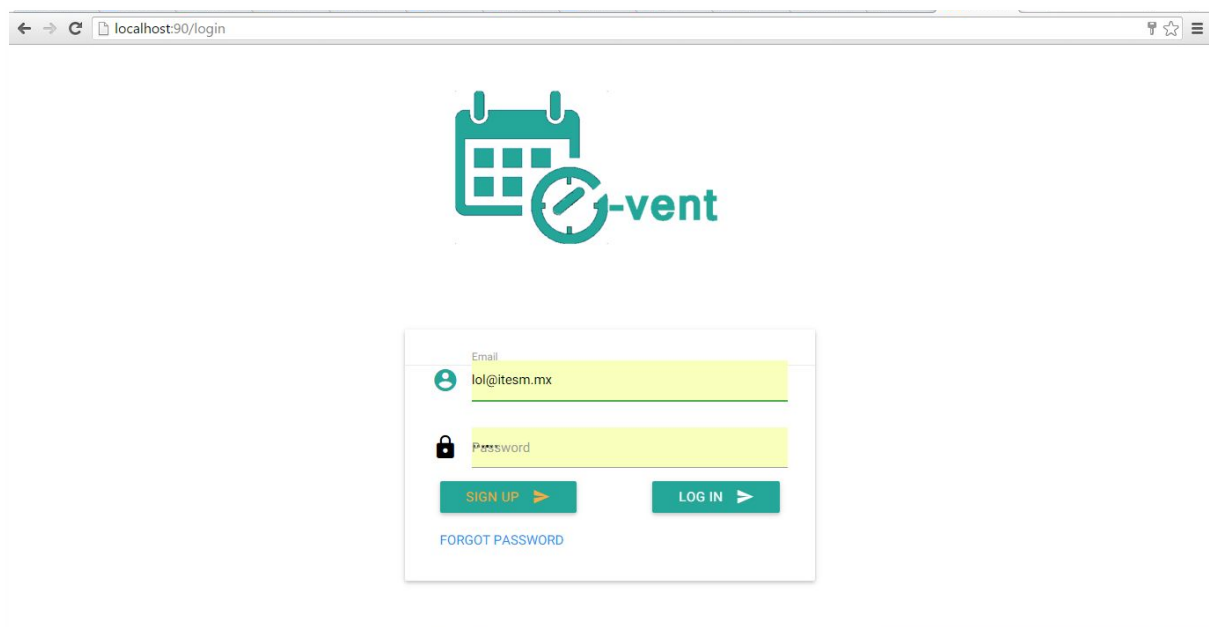

Download the project from <https://github.com/Fernandogza/Webdev-Lab> and extract it on the folder of htdocs, it is important that all files should not be on a folder different from htdocs or inside of another folder inside htdocs. It should look like this:

Then go to:

*localhost* or *localhost/admin/login*

Depending on the view you want to access, the localhost displays the user interface and localhost/admin/login shows the admin interface

← → ↻ localhost:90/admin/login
